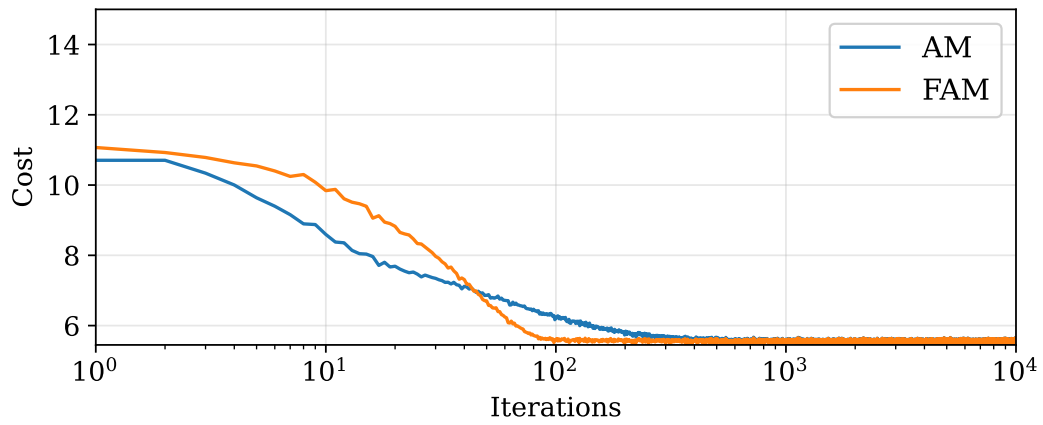

Figure 1: OU easy

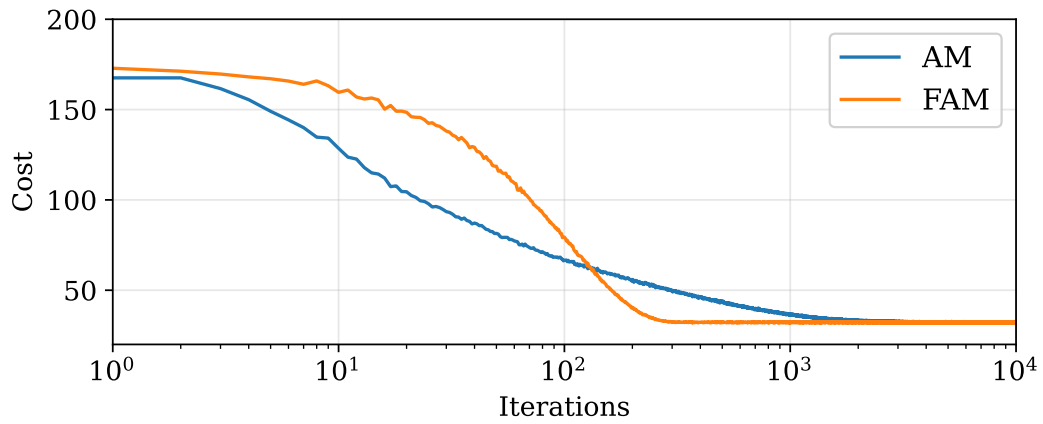

Figure 2: OU hard

Per-seed trajectories — instability of AM vs monotone decrease of FAM

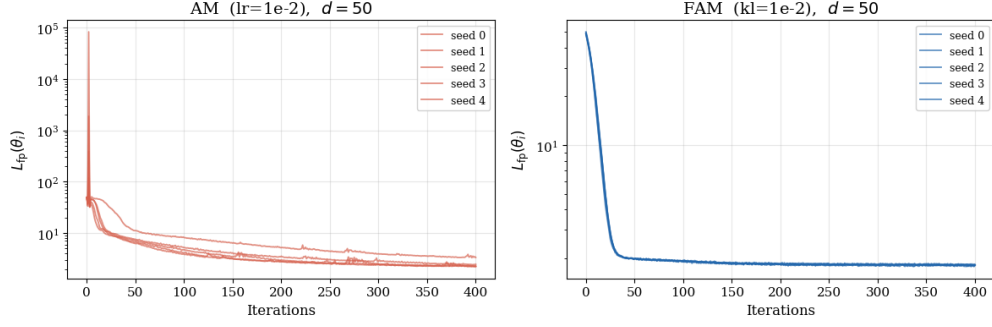

Figure 3: Loss curves for Adjoint Sampling. **Left:** Adam-only AM exhibits unstable, non-monotonic training. **Right:** FAM achieves a monotonic decrease in loss.

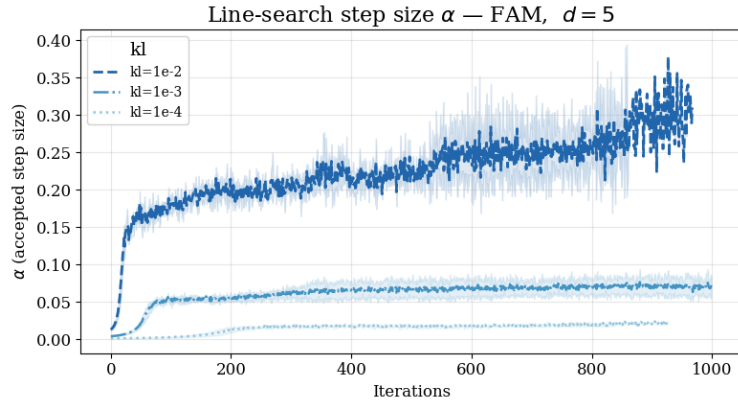

Figure 4: Accepted line-search step size α over training for FAM at $d = 5$ (Adjoint Sampling), averaged over 5 seeds (shaded region: ± 1 std). α remains strictly positive and grows monotonically across all KL budgets κ , confirming that the line search does not degenerate under mini-batch gradients. Larger κ permits larger accepted steps.
